Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A system comprising:

a frequency-stepped radar configured to induce vibrations in a landmine using different frequencies;

a sensor configured to detect <u>electromagnetic</u> signals associated with the vibrations; and a processor configured to process the signals to detect the landmine.

2. (Currently Amended) A method comprising:

using a frequency-stepped radar to sequentially induce vibrations of different frequencies in a landmine;

detecting <u>electromagnetic</u> signals associated with the vibrations; and processing the signals to detect the landmine.

- 3. (New) The method of claim 2 wherein processing the signals to detect the landmine comprises removing, from the detected signals, signal components related to frequency clutter that is not associated with a buried landmine.
- 4. (New) The method of claim 2 wherein processing the signals to detect the landmine comprises processing detected signals from all frequencies to reduce speckle effects.
- 5. (New) The method of claim 2 wherein processing the signals to detect the landmine comprises measuring a peak of a processed signal to determine vibration displacement.

6. (New) The method of claim 5 further comprising converting the determined vibration displacement to an audible signal.

- 7. (New) The method of claim 5 wherein processing the signals to detect the landmine comprises identifying whether the determined vibration displacement is consistent with a landmine.
- 8. (New) The method of claim 7 wherein identifying whether the determined vibration displacement is consistent with a landmine comprises:

comparing the determined vibration displacement with a previously determined vibration displacement; and

identifying that the determined vibration displacement is consistent with a landmine in response to a result of the comparison that exceeds a threshold difference.

- 9. (New) The method of claim 2 further comprising presenting an audible signal when a landmine is detected.
- 10. (New) The system of claim 1 further comprising a metal detection sensor configured to detect metal.
- 11. (New) The system of claim 1 wherein the processor is further configured to remove, from the detected signals, signal components related to frequency clutter that is not associated with a buried landmine.
- 12. (New) The system of claim 1 wherein the processor is further configured to process detected signals from all frequencies to reduce speckle effects.
- 13. (New) The system of claim 1 wherein the processor is further configured to measure a peak of a processed signal to determine vibration displacement.

14. (New) The system of claim 13 the processor is further configured to convert the determined vibration displacement to an audible signal.

- 15. (New) The system of claim 13 the processor is further configured to identify whether the determined vibration displacement is consistent with a landmine.
- 16. (New) The system of claim 15 wherein the processor is further configured to: compare the determined vibration displacement with a previously determined vibration displacement; and

identify that the determined vibration displacement is consistent with a landmine in response to a result of the comparison that exceeds a threshold difference.

17. (New) The system of claim 1 the processor is further configured to present an audible signal when a landmine is detected.
